

## The Polio Vaccine was NOT the Result of Animal Experiments....

- Animal experimentation actually delayed this much-needed vaccine throughout the first half of the 20th century.
- researchers successfully infected monkeys with polio. But because monkeys contract polio nasally rather than orally, this "triumph" only postponed the development of an effective vaccine for decades. Incredibly, the scientists working on the vaccine chose to ignore the human digestive data in favour of the monkey data!
- It is true that a "vaccine" was derived from animal experimentation. But manufactured from monkey tissue, this "cure" resulted in six human deaths and 12 cases of paralysis.
- nearly 30 years earlier. Sabin later denounced the monkey model blunder:  
"... prevention was long delayed by the erroneous conception of the nature of the human disease based on misleading experimental models of the disease in monkeys."
- Containing the live virus, the animal-based vaccine infected 204 people with polio and resulted in 11 documented deaths. It also resulted in at least one virus (SV40) jumping the species barrier and infecting humans. Because of that, the polio vaccine is now grown in human diploid-cell culture rather than animal tissue.
